

WILD EARTH® BIOCHAR

Top Dressed Lawns uses and sells Wild Earth® Biochar, which is a relatively new term for charcoal used as a soil additive. However, the idea of incorporating charred matter into soil is centuries old. This practice resulted in what is now known as terra preta, dark, fertile soil with high charcoal content found in South America's Amazon Basin; created thousands of years ago, terra preta soils have shown above-average nutrient levels and better retention of those nutrients yielding high crop productivity.

The Biochar itself is a form of carbon that lasts thousands of years in the soil, providing a baseline of stable soil carbon. Also, Biochar acts like a condominium for soil biota, as it retains nutrients in the soil, even during heavy rains. This allows the grower to purchase and apply less fertilizer for years after the Biochar has been added to the soil while receiving ongoing improved yields.

If you are in charge of managing a large area of turf and you need an organic turf product, then consider one of the Wild Earth® Soil Mix products. Wild Earth® creates unique mixes that combine the right natural material and amendments. Biochar and Biochar soil mixes are designed to make your sports turf, city park, golf course look amazing on top and optimize your root zones health! Make your soil strong and healthy with an immediate impact from our engineered compost soils, ABS amendments, and the right balance of good bacteria and fungi.
